MONDAY, NOVEMBER 2ND, 2020

4 PM - 5 PM ~ ON WEBEX

MULTISCALE IMAGING OF MULTIPLE MYELOMA PATHOGENESIS

Multiple myeloma is an age-related, largely incurable hematological malignancy of clonal plasma cells. Myeloma pathogenesis starts with diffuse accumulation of malignant plasma cells in the bone marrow followed by focal lytic lesions and end organ damage. Radiological data are crucial for defining and managing multiple myeloma. This lecture will cover application of optical, nuclear and magnetic resonance modalities for imaging multiple myeloma.

Monica Shokeen, MBA, PhD

Assistant Professor of Radiology
Principal Investigator of the Shokeen
Molecular Imaging Lab
Optical Radiology Lab
Mallinckrodt Institute of Radiology
Washington University School of Medicine
